TITLE OF INVENTION: resistance against fungi
FILE REFERENCE: 3581.010501
CURRENT PELLING NUMBER: US/10/512,184
CURRENT FILING DATE: 2004-10-22
NUMBER OF SEQ ID NOS: 72
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 71
LENGTH: 371
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OTHER INFORMATION: Description of Artificial Sequence: fusion protein; OTHER INFORMATION: comprising the leader peptide - chitinase- linker; OTHER INFORMATION: - SCEV PL2 - cmyc/His6.

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Claim 1; SEQ ID NO 10; 164pp; French

οĘ The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with

```
ö
hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and prostate, lung psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF+IR and/or EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.
                                                                                                                                                                                                        Gaps

```

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of

```
comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined is amino decrafining region (CDR) consisting of one of two fully defined is amino caids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illiness connected with an overexpression and/or an abnormal activation of the IGR-IM and/or EGRP, and/or connected with a decivation of the IGR-IM and/or EGRP, with IGR-IM and/or connected with a historic indication of the transduction pathway of the signal mediated by the induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGR-dependent, especially IGR1 and/or IGR2.

CC dependent and/or EGR-dependent and/or HERZ/neu-dependent cells. (1) is useful for preparation of a medicament intended to inhibit the growth and/or the proliferation of tumor cells, preferably IGR-dependent and/or EGR-dependent and/or EGR-dependent and/or EGR-dependent and/or EGR-dependent and/or IGR-dependent and/or IGR-dependent and/or IGR-dependent cells. (1) is useful in the preparation of a medicament intended for the treatment of proriation of the invention or for the cancer, endometrial cancer or colon cancer. (1) is useful in the prevention or for the preparation of a medicament intended for the prevention or for the prevention or for the treatment of psoriasis. (1) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to treatment of psoriasis. (1) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to searching from a biological sample in which the abnormal present of IRR and/or EGR receptor is suspected, which invented or the preparation of the invented in the exemplification of the

)

This invention describes a novel bispecific antibody which can act as a cofactor to enhance an enzyme reaction and can recognize the enzyme and the enzyme substrate. The antibody specifically binds to blood coagulation factor VIII. The invention also describes a composition comprising the antibody and a carrier, a kit useful in preventing and/or treating bleeding associated with a disorder or from a disease caused by Murine factor IX directed antibody CDR2 SEQ ID NO 111.                                                                                                                                                                                                                      The invention relates to a method for preparing variable region genes of high affinity tumor necrosis factor (TNF) resistant monoclonal antibody (Fe mAb). The method comprises using recombinant human TNF immune BALB/c mouse to prepare mouse anti-TNF monoclonal antibody, screening high affinity F6 mAb using an indirect enzyme linked immunosorbent assay (ELISA). By cloning the monoclonal antibody light chain and heavy chain variable region (VL and VH respectively) genes, the monoclonal antibody light chain and heavy chain variable region gene sequence and amino acid sequence can be obtained, and the unicity of the gene sequence and protein sequence can be confirmed. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
Variable region gene of high affinity monoclonal antibody of tumor necrosis factor and its preparation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

bleeding. The composition includes blood coagulation factor VIII. The antibody of the invention can be a blood-coagulation fibrinolysis related factor including blood-coagulation factor VIII. blood coagulation factor X, or blood-coagulation factor IX. The antibody comprises a complementary determining region (CDR) of anti-blood-coagulation factor IX/IXa factor antibody. The novel antibody or composition is useful for preventing and/or treating a disease accompanying bleeding, or the disease resulting crown bleeding where the disease accompanying bleeding or the disease the cresulting from bleeding develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the captelops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the coagulation factor VIII and/or activation blood coagulation factor VIII. The mophilia A or von Willebrand disease, where the hemophilia is an acquired hemophilia A. This sequence represents a fragment of the antibody described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but the well print by the print by the print directly from WIPO at the print but by the print directly from WIPO at

This invention describes a novel bispecific antibody which can act as a cofactor to enhance an enzyme reaction and can recognize the enzyme and the enzyme substrate. The antibody specifically binds to blood coaquilation factor VIII. The invention also describes a composition comprising the antibody and a carrier, a kit useful in preventing and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel bispecific antibody substituting for function of cofactor that enhances enzyme reaction, and recognizing both enzyme and substrates of enzyme, useful for treating hemophilia A.

bleeding. The composition can be a blood coagulation factor VIII. The antibody of the invention can be a blood-coagulation factor VIII. The antibody of the invention can be a blood-coagulation factor vIII. The factor including blood-coagulation factor including blood-coagulation factor IX. The antibody comprises a complementary determining region (CDR) of anti-blood-coagulation factor IX/IXa factor cantibody. The novel antibody or composition is useful for preventing and/or treating a disease accompanying bleeding, or the disease resulting cand/or treating a disease accompanying bleeding or the disease resulting crom bleeding develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the capulation factor VIII and/or activation blood coagulation factor VIII. is hemophilia A or von Willebrand (seese, where the hemophilia is an acquired hemophilia A. This sequence represents a fragment of the antibody described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the was obtained in electronic format directly from WIPO at the was obtained when the method published_pot_esquences. treating bleeding associated with a disorder or from a disease caused by 0555555555555555555555555888

Novel bispecific antibody substituting for functional protein or substituting for ligand for receptor comprising two types of molecules, useful as pharmaceutical for treating or preventing diseases e.g. bleeding

Claim 18; SEQ ID NO 73; 143pp; Japanese.

The specification describes a bispecific antibody substituting for functional protein or substituting for a ligand for a receptor comprising two types of molecules. The antibody comprises AR1 and AR2 chains. 

```
The invention relates to a bispecific antibody (I) substituting for: a functional protein and having ligand functional alternative activity with respect to receptor containing herecomolecule; or a functional cofactor which enhances an enzyme reaction and recognizes both substrates of enzyme. Also claimed are a composition (II) containing (I). (I) and (II) care useful for preventing and/or treating viral disease, neoplasm, or immunological disease, or bleeding or disease resulting from bleeding. The viral disease is a hepatitis C virus or hepatitis B virus infection. The viral disease is a hepatitis C virus or hepatitic carcinoma. The neoplasms are chronic myeloid leukemia, malignant melanoma, multiple myeloma, renal carcinoma, glioblastoma, medilloblastoma, astrocycoma, hairy cell leukemia, AlDS-related Kaposi's sarcoma, skin T cell lymphoma. The immunological disease is multiple clonenties. The bleeding disease is the disease is multiple clorents. The bleeding disease is the disease resulting from the active reduction or a defect of blood coagulation factor VIII such as hemophilia
                                                                                                                                                                                                                                                                                  ö
Bispecific antibodies of the invention are useful for preventing and treating bleeding, diseases accompanying bleeding or diseases resulting from bleeding. These diseases develop or progress by active reduction of blood coagulation factor VIII/activated blood coagulation factor VIII/activated blood manual actor VIII, present sequence represents a complementarity determining region (CDR) from a variable heavy chain region, which was used to construct bispecific antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel bispecific antibody substituting for functional protein and having ligand functional alternative activity to receptor containing heteromolecule, useful for preventing/treating viral disease, immunological disease or bleeding.

This invention describes a novel bispecific antibody which can act as a cofactor to enhance an enzyme reaction and can recognize the enzyme aubstrate. The antibody specifically binds to blood coagulation factor VIII. The invention and describes a composition comprising the antibody and a carrier, a kit useful in preventing and/or treating bleeding associated with a disorder or from a disease caused by bleeding. The composition includes blood coagulation factor VIII. The antibody of the invention can be a blood-coagulation factor including blood-coagulation factor IX. The antibody comprises a complementary determining region (CDR) of anti-blood-coagulation factor IX. The antibody. The novel antibody or composition is useful for preventing and/or treating a disease accompanying bleeding or the disease realling from bleeding where the disease accompanying bleeding or the disease realling from bleeding develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII in the hemophilia is
                                                                                                                                                                                                                                                                                 ö
or von Willebrand disease. (II) is useful for manufacturing (I). (I) has high stability and low antigenicity in blood. The present sequence represents a mouse anti-s AR antibody CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bispecific antibody, blood coagulation factor VIII; bleeding; fibrinolysis; blood coagulation factor X; blood-coagulation factor IX; factor VIII deficiency; von Willebrands disease; hemostatic; immunostimulator; antibody engineering; ds; gene.

CC This invention describes a novel bispecific antibody which can act as a cofactor to enhance an enzyme reaction and can recognize the enzyme and the enzyme substrate. The antibody specifically binds to blood coagulation factor VIII. The invention also describes a composition coagulation factor VIII. The invention also describes a composition of the antibody and a carrier, a kit useful in preventing and/or comprising the antibody and a carrier, a kit useful in preventing and/or treating bleeding associated with a disorder or from a disease caused by bleeding. The composition includes blood coagulation factor VIII. The antibody of the invention cator in Earth actor including blood-coagulation factor VIII, bomod coagulation factor of factor including blood-coagulation factor in the coagulation factor in the coagulation factor in the coagulation factor in the disease a complementary determining region (CDR) of anti-blood-coagulation factor in useful for preventing candior treating a disease accompanying bleeding or the disease resulting from bleeding develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the coagulation factor VIII. The disease the blood coagulation factor VIII. The disease the blood coagulation factor VIII. The disease the blood coagulation factor VIII. The disease the blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii blood coagulation factor viii and/or active reduction of the
                                                                                                                                                                                                                                     ô
an acquired hemophilia A. This sequence encodes a fragment of the antibody described in the method of the invention. Note: The sequence adata for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel bispecific antibody substituting for function of cofactor that enhances enzyme reaction, and recognizing both enzyme and substrates of enzyme, useful for treating hemophilia A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bispecific antibody; blood coagulation factor VIII; bleeding; fibrinolysis; blood coagulation factor X; blood-coagulation factor IX; factor VIII deficiency; von Willebrands disease; hemostatic; immunostimulator; antibody engineering.
                                                                                                                                                                                                                                     Gaps

The antibody comprises ARI and AR2 chains. Bispecific antibodies of the invention are useful for preventing and treating bleeding, diseases accompanying bleeding or diseases resulting from bleeding. These diseases develop or progress by active reduction of blood coagulation factor VIII/activated blood coagulation factor VIII/activated blood coagulation factor VIII, present sequence represents a complementarity determining region (CDR) from a variable heavy chain region, which was used to construct
                                                                                                                                                                                                                                                                                                                                                                                                                                                               bispecific antibody; AR1 chain; AR2 chain; hemostatic; bleeding; antibody therapy; blood coagulation factor VIII; factor VIII deficiency; von willebrands disease; heavy chain; complementarity determining region; CDR.
              an acquired hemophilia A. This sequence represents a fragment of the anthody described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to a bispecific antibody (I) substituting for: a functional protein and having ligand functional alternative activity with respect to receptor containing heteromolecule; or a functional cofactor which enhances an enzyme reaction and recognizes both substrates of enzyme. Also claimed are a composition (II) containing (I). (I) and (II) care useful for preventing and/or treating viral disease, neoplasm, or immunological disease, or bleeding or disease resulting from bleeding. The viral disease is a hepatitis C virus or hepatitis B virus infection who viral disease is a hepatitis C virus or hepatitic carcinoma. The neoplasms are chronic myeloid leukemia, medulloblastoma, multiple myeloma, real leukemia, AlDS-related Kaposi's sarcoma, skin T cell lymphoma or non-Hodgkin's lymphoma. The immunological disease is multiple sclosus. The bleeding disease is the disease resulting from the active reduction or a defect of blood coaqulation factor VIII such as hemophilia or von Willebrand disease. (II) is useful for manufacturing (I). (I) has chigh stability and low antigenicity in blood. The present sequence

cofactor to enhance an enzyme reaction and can recognize the enzyme and cofactor to enhance an enzyme reaction and can recognize the enzyme and coffice the enzyme substrate. The antibody specifically binds to blood coagulation factor VIII. The invention also describes a composition comprising the antibody and a carrier, a kit useful in preventing and/or comprising the antibody and a carrier, a kit useful in preventing and/or comprising the antibody and a carrier, a kit useful in preventing and/or composition includes blood coagulation factor VIII. The antibody of the invention can be a blood-coagulation fibrinolysis related cartor including blood-coagulation factor VIII, blood coagulation factor X, or blood-coagulation factor IX/IX factor antibody. The novel antibody or composition is useful for preventing cantibody. The novel antibody or composition is useful for preventing cantibody. The novel antibody or composition is useful for preventing from bleeding develops and/or progresses by an active reduction or deletion of the develops and/or progresses by an active reduction or deletion of the correct or the blood coagulation factor VIII. The disease the develops and/or progresses by an active reduction or deletion of the correct or deletion of the correct or von Willebrand disease, where the hemophilia is an acquired hemophilia A. This sequence represents a fragment of the antibody described in the method of the invention. Note: The sequence correct or this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel bispecific antibody substituting for function of cofactor that enhances enzyme reaction, and recognizing both enzyme and substrates of enzyme, useful for treating hemophilia A.
                                                                                                                                                                                                                                                                                                                                                                                                                                        bispecific antibody; blood coagulation factor VIII; bleeding; fibrinolysis; blood coagulation factor X; blood-coagulation factor IX; factor VIII deficiency; von Willebrands disease; hemostatic;

The invention relates to a chimeric antibody, or an Fv-type single-chain fragment, derived from the murine monoclonal antibody IOR C5 expressed by hybridoma ECCS 97061101. It contains the CDRs (complementarity determining regions) of IOR C5 and human constant regions, in both heavy and light chains. The IOR C5 antibody specifically binds to the IOR C2 antigen which is expressed on malignant and normal colorectal cells. The invention also encompasses a cell line which expresses the humanised IOR C5 antibody, host cells which express the Fv fragment; a pharmaceutical composition for treatment, location or in vivo identification of malignant tumours of colon and rectum, including their metastases and recurrences, containing the humanised antibody or the Fv fragment thereof, plus an excipient; and a method for the in vivo diagnosis of thereof, plus an excipient; and a method for the in vivo diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tumours comprising the administration of a 99m-technetium-labelled humanised IOR C5 antibody or Fv fragment, and monitoring biodistribution by radiography. The humanised IOR C5 antibody and/or its Fv fragment are used to treat malignant tumours of the colon or rectum, including their metastases or recurrences, and for in vivo diagnosis (imaging) of tumours, particularly when radiolabelled. Sequences AAB73649-AAB73651 represent, respectively, CDRs 1-3 of the heavy chain variable region (VH)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mateo De Acosta Del Rio CM, Roque Navarro LT, Morales Morales A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                            The inventors claim a chimeric monoclonal antibody which contains a urokinase-recognising antibody heavy chain variable region contg.at least one of the polypeptide chains G, H and I (ARM24717, R24718, ARM24719) and a human antibody heavy chain content region. The chimeric Abs can be used both in vivo and in vitro and, since they have very low immunogenicity as compared with mouse Abs, they can be administered to humans for diagnostic and therapeutic purposes. They are also more stable and show a longer half-life in the blood as compared with the original mouse Abs. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                      Chimeric monoclonal antibodies - contain anti-human fibrin antibody light and heavy chain variable and constant for treating thrombotic conditions e.g. myocardial infarction.

The invention describes a non-murine antibody (1) that competes with monoclonal antibody RX1 for binding to macrophage colony stimulating cator (M-CSP) by more than 75%, where the monoclonal antibody RX1 has the heavy chain and light chain mino acids sequences having a fully defined 447 amino acids (SEQ ID No. 2) and 214 amino acids (SEQ ID No. 4) sequences given in the specification, respecitively. (1) is useful for preventing a subject afflicted with a disease that causes or contributes to osteolysis, where the antibody effectively reduces the severity of the lone loss associated with the disease. The disease is chosen from metabolic bone diseases associated with relatively increased osteoclast activity, including endocrinopathies, hypercalcemia, deficiency states, corronic diseases, and hereditary diseases, cancer, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteoporosis, osteolysis, metastatic cancer to bone and cancer. (1) is useful for preventing or reducing or reducing or manufacturing a medicament for preventing or reducing bone loss, osteolysis, metastatic cancer to bone and cancer. (1) is useful for manufacturing a medicament for preventing or contributes to osteolysis, and metastatic cancer to bone in a patient sifering a patient affilicted with a disease that causes or contributes to sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

rRNA N-glycosidase (EC 3.2.2.22) trichokirin - Mongolian snake-gourd (fragment)
N;Alternate names: ribosome-incativating protein trichokirin
C;Species: Trichosanthes kirilowii (Mongolian snake-gourd)
C;Date: 01-Dec-1989 #sequence_revision 01-Dec-1989 #text_change 09-Jul-2004
C;Accession: S01669
R;Casellas, P.; Dussossoy, D.; Falasca, A.I.; Barbieri, L.; Guillemot, J.C.; Ferrara, P. Bur: J. Biochem. 176, 581-588, 1988

Ou W J., Thomas D.Y., Bell A.W., Bergeron J.J.;
"Casein kinase II phosphorylation of signal sequence receptor alpha and the associated membrane chaperone calnexin.";

    -!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
    Type 1 RIP subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-MAY'2000 (TrEMBLrel. 13, Created)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2003-569653/53. N-PSDB; ADJ76845 New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Claim 1; SEQ ID NO 12; 164pp; French

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (BGFR) and/or with

```
ö
                         these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of ICRT and OFT EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neoplasm, prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetries; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsorlatic; psorlasis; dermatological disease; immune disorder.

```

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of

```
comprising a light or heavy chain wings activity of the foreign.

Comprising a light or heavy chain waving at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino caids (ADZ670014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF1 R and/or EGFR, and/or connected with an overexpression and/or an abnormal charaction of IGF1 or IGF2 with IGF1R and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2 dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 raceptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (II) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or the verexpression and/or abnormal activity of IGF-IR and/or pinkh overexpression pathways mediated by interaction of these receptors with their ligands. Especially they inhibit and/or proliferation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also by abnormal expression of IGF-IR and/or BGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               insulin-like growth factor-1 receptor; IGP-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                        New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                       The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of transformation of tumor cells, so are useful against cancers of the proliferation of tumor cells, so are useful against cancers of the procease. Jung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriatis. A bare a lso used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a

ö
           treat diseases associated with overexpression and/or abnormal activity of fGP-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit growth and/or proliferation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.

```

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (IGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells, so are useful against cancers of the

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

cof an illness connected with an overexpression and/or an abnormal activation of a medicament intermed and or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a cativation of the IGF-IR and/or EGFR, and/or of the signal mediated by the interaction of IGFI or IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, appecially IGFI and/or IGF2.

C dependent and/or EGF-dependent and/or HER2/neu-dependent cells. (I) is useful for preparation of a medicament intended to inhibit the growth and/or IGF2-dependent and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a novel isolated anti-insulin-like growth factor of receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of an addicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with an overexpression and/or an abnormal of interaction of the IGF-IR and/or EGFR, and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of EGFR, where the administration of the medicament does not induce or only slightly receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral capendant and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (1), which is optionally labeled. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                            invention relates to a novel isolated anti-insulin-like growth factor
                                                                                                                                                                                                                      Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Murine immunoglobulin heavy chain variable region 7C10 VH SEQ ID NO:69.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, WPI; 2005-321968/33

Example 13; SEQ ID NO 69; 125pp; English.

The invention relates to a novel isolated anti-insulin-like growth factor

I receptor (IGF-IR) antibody (I) or its functional fragment, being
capable of binding to human IGF-IR and, if necessary, capable of
specifically inhibiting troshne kinase activity of the receptor,
comprising a light or heavy chain having at least one complementary
determining region (CDR) consisting of one of two fully defined is amino
acids (ADS67006 and ADS67014). An antibody of the invention is useful in
the preparation of a medicament intended for the prevention or treatment
of an illness connected with an overexpression and/or an abnormal
activation of the transduction pathway of the signal mediated by the
interaction of the transduction pathway of the signal mediated by the
interaction of the transduction pathway of the signal mediated by the
interaction of the transduction pathway of the signal mediated by the
interaction of the transduction pathway of the signal mediated by the
interaction of the transformation of normal cells into cells with tumoral
creeptor. The antibody is useful for preparation of the insulin
receptor. The antibody is useful for preparation of the insulin
receptor. The antibody is useful for preparation of the insulin
considered for preparation of a medicament intended to inhibit the growth
and/or the proliferation of a medicament and/or EGP-dependent
consent intended for prevention or for the treatment of cancer,
the cancer is chosen from prostate cancer, osetosarcoma, lung cancer,
the cancer is chosen from prostate cancer, osetosarcoma, lung cancer,
the cancer is chosen from prostate cancer, osetosarcoma, lung cancer,
the cancer, endometrial cancer or colon cancer. (I) is useful in the
preparation of a medicament intended for the prevention or for the
preparation of a medicament intended for the prevention or for the prevention or or percaptessing of illnesses induced by an
overapression or an underexpression of the log-ill septenting from a biological sample in which the abnormal present or growth

activation of the IGF-IR and/or EGFR, and/or connected with a activation of the IGF-IR and/or EGFR, and/or connected with a cativation of the IGF-IR and/or EGFR, and/or of the signal mediated by the interactivation of IGF1 or IGF2-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2-C dependent and/or EGF-dependent and/or HER2/neu-dependent cells. (I) is useful for preparation of a medicament intended to inhibit the growth and/or IGF2-dependent and/or EGF-dependent and/or IGF2-dependent and/or EGF-dependent of a medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer. (I) is useful in the preparation of a medicament intended for the specific targeting of a biologically active compound to the specific targeting of a biologically active compound to cells expressing or overexpressing to voerexpressing to voerexpressing to which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample in which the abnormal present.

CE Rand/or EGFR receptor is suspected, which involves contacting the biological sample with (I), which is optionally labeled. The present
